

URBAN STRIKE

**Build a powerful gunship.
Choose your targets. Change the
battlefield.**

A focused adaptation of survivor-style progression for the existing Urban Strike / Heli-Strike project. Colorful combat, purposeful flight, and meaningful missions reinforce one another.

01
CHOOSE A TARGET

02
FIGHT & MANEUVER

03
EARN AN UPGRADE

04
FACE NEW PRESSURE

THREE DESIGN PILLARS

Purposeful flight

Objectives, supplies, and enemy roles give movement a reason.

Visible power growth

Major upgrades change firing behavior, sound, and appearance.

Readable intensity

Continuous pressure stays exciting without hiding threats or escape routes.

Ten ideas that fit the game

Extend existing systems first. These are proposed adaptations, not a claim that the features are already implemented.

FEATURE	URBAN STRIKE ADAPTATION & GUARDRAIL
01 Weapon evolutions	Chaingun to armor-piercing cannon; guided missiles to a limited multi-target salvo. Explain requirements and preserve ammo rules.
02 Distinct builds	Gunner, missile specialist, Mini Helicopter commander, and electronic warfare. Give each a clear strength and tradeoff.
03 Behavior upgrades	Limited penetration, one ricochet, coordinated wingman fire, or EMP countermeasures. Bound splitting and chain reactions.
04 Risk vs. reward	Extend Secure LZ into an optional supply-beacon defense while continuous combat remains active.
05 Exploration rewards	Guarded ammo trucks, repair pads, and upgrade caches reward tactical detours.
06 XP collection bursts	A Recovery Drone attracts nearby XP. Preserve every value and award it exactly once.
07 Memorable elites	Armored command vehicles, escorted jammers, and heavy aircraft need readable weaknesses.
08 Pressure pacing	Alternate pursuit, coordinated interception, and lighter harassment while spawning continues.
09 Helicopter loadouts	Scout, armored gunship, and support carrier with different starting equipment and tradeoffs.
10 Run summaries	Show weapon damage, kills, missions, survival time, and final upgrades using recorded results.

Four ways to fly and fight

Prototype three builds first. Add the fourth when its underlying mechanics and balancing are ready.

01 GUNNER

Sustained fire and crowd control

Better cooling, limited penetration, and suppression.
Evolves toward an armor-piercing cannon.

Tradeoff: Lower burst damage.

02 MISSILE SPECIALIST

Priority targets and armored threats

Guidance and reload upgrades lead toward a bounded multi-target salvo.

Tradeoff: Limited by ammunition and lock opportunities.

03 MINI HELICOPTER COMMANDER

Coverage and coordinated support

Wingmen focus marked targets and use complementary firing roles. Their count remains capped.

Tradeoff: Lower direct firepower.

04 ELECTRONIC WARFARE

Control and safer repositioning

Countermeasure upgrades disrupt targeting or create a brief EMP escape opportunity.

Tradeoff: Trades raw damage for control.

Build test: a player should notice the difference through targets, firing patterns, and movement - not only a larger damage number.

Make every action register

Presentation explains combat. Missions create changes that players can see and exploit.

COMBAT FEEDBACK LADDER

01 Ordinary hit

Outlined number, quick pop, brief enemy flash, small sparks, and a restrained impact sound.

02 Important hit

Actual critical-hit metadata receives gold emphasis. Player damage has a distinct red treatment.

03 Major event

Missile impacts, elite kills, and mission-target destruction receive stronger bounded effects and optional low camera shake.

Readability budget

Pool labels and effects, combine compatible rapid-fire hits over roughly 100 ms, suppress offscreen numbers, and never apply global hit-stop to every bullet.

MISSION -> BATTLEFIELD CONSEQUENCE

Destroy Radar	Weaker SAM tracking; a safer route through contested airspace.
Destroy Jammer	Targeting interference ends; announce restored capability.
Secure LZ	A temporary resupply opportunity earned while enemies continue attacking.

Use short radio confirmations such as: "Radar down - SAM tracking weakened." Trigger rewards and destruction effects once.

Build depth in the right order

Finish each stage with focused gameplay checks. Preserve existing work and avoid a broad rewrite.

1

Reliable foundation

Verify spawning, separation, targeting, XP, missions, and performance.

2

Combat feedback

Pool and polish damage numbers; add truthful categories, aggregation, sounds, and bounded effects.

3

Three build prototypes

Develop gunner, missile, and Mini Helicopter builds from existing equipment.

4

Weapon evolutions

Add visible transformations with clear prerequisites and consistent ammo behavior.

5

Objectives and rewards

Extend LZ, supply caches, and mission consequences while preserving continuous combat.

6

Elites and pressure

Add distinct threats and periods of lighter harassment; retain escape routes.

7

Run summaries, then loadouts

Record useful results first; add helicopters after the core run feels strong.

ACCEPTANCE CHECK

Compare the same route at 1280 x 720 on LOW and MEDIUM. Record average FPS, 1% lows where available, worst frame time, draw calls, and peak nodes. Include at least five minutes of combat and heavy effects. Target 60 FPS; report only measured results.

Scope: planning document, not an implementation or performance certification. Examples and tuning values are starting proposals.
